

4 points for biorevitalization

The most common treated areas are submural and malarial. In particular to treat these areas, we suggest to use EJAL 40 with a more innovative 4-points biorevitalization technique.

4 BRP - 4 Bio Revitalization Points technique allows you to use a 0.25 ml injection with a 30G ne-

edle on each side of the face with only 4 points, minimizing the risk of blood leakage and optimizing the effectiveness through the most homogeneous and fluid injection of hyaluronic acid.

It is suggested to apply the technique following the protocol.

Ejal 40®
Revitalization Far

THE HYALURONIC ACID

What is the best bio-revitalization?

Among the great number of products for bio-revitalization, it is not easy to choose the proper one. The following table illustrates that is not only convenient and simple to use but also performing fast and prolonged results. EJAL 40 with this optimal formula that stimulates biological activity of HA the following weight of HA: 40mg / 2ml and 1200 mg/g.

- 3 treatments at a distance of one month follow by a two-month maintenance depending on the aging level. EJAL 40 is particularly suitable for the treatment of skin laxity, wrinkles, decreased tone and elasticity and before the use of intradermal fillers.
- Repeat the cycle twice per year.
- On the aging level.

Protocol

4 Reasons to choose EJAL 40

EJAL 40 is the latest generation of hyaluronic acid that increases the biosynthetic capacity of fibroblasts induced to rebuild the basic structure of the extra cellular matrix (ECM) physiologically environment, enhancing the cellular activities, hydration, and synthesis of collagen, elastic and hyaluronic acid. So that the cells involved in the regeneration phase of new fibers can establish again the natural function and hyaluronic acid.

EJAL 40 thanks to our experience and elimination relationships. For this reason, thanks to our experience and with tests in the best way the repeaters of hyaluronic acid present in the skin easily reducing and eliminating the help of the major Italian Research Centres, we have chosen among the many possible combinations to its effectiveness is able

EJAL 40 is an innovative hyaluronic acid formulation that revitalizes the skin already dehydrated and damaged with a restucture and reinforce the extra cellular matrix to restore the physiological, sterile, biodegradable and isotonic buffer. A syringe pre-filled contains 2.0 ml of gel, sterilized.

EJAL 40 thanks to its effectiveness is able to aging and solar exposure. A syringe pre-filled contains 2.0 ml of gel, sterilized.

Towards the eternal beauty

The repairing process of the aged skin is another step ahead in this direction: it restores the physiological functions of the skin and improves skin characteristics by restructuring skin collagen fibers. Over the last few decades during which many success skin and improves skin compactness by restoring the biochemical dynamic event, and it has been studied directly of fibroblasts and to the creation of new collagen extracellular matrix, which generates an optimal micro-environment able to stimulate the proliferation and migration of fibroblasts, endothelial cells, keratinocytes, and neonan-giogenesis. The extracellular matrix thanks to the stimulation of hyaluronic acid, a fundamental element of the extracellular matrix has been achieved thanks to the effectiveness of hyaluronic acid that stimulates the proliferation and migration of fibroblasts and to the creation of new collagen and elastin fibers. This repair step is the final stage of the repairing process of the aged skin.

EJAL 40 bio-revitalizing gel is another step ahead in this direction: it restores the physiological functions of the skin and improves skin characteristics by restructuring skin collagen fibers. The main characteristic of aging, one of the main characteristics is the fragmentation of the extra cellular matrix (ECM) and collagen fibers. In fact, collagen fragmentation is responsible for loss of structural integrity and impairment of fibroblast function of skin. Treatment with hyaluronic acid that stimulates the production of new collagen will provide a substantial improvement to the appearance and health of aged skin.
